

# Transmission Media

# Transmission Media

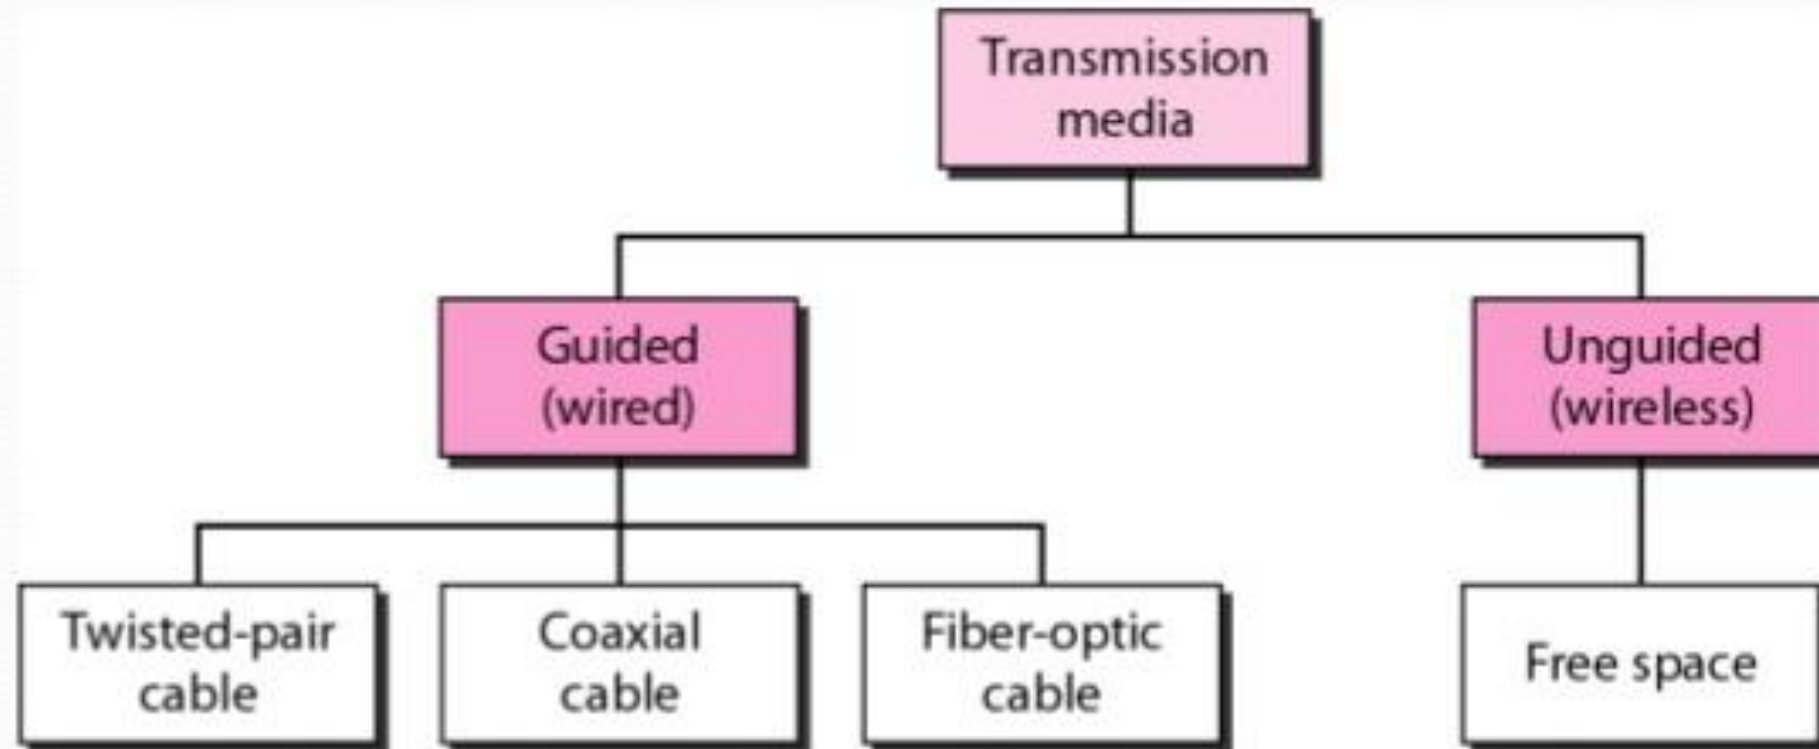

- A transmission **medium** can be broadly defined as anything that can carry information from a source to a destination.
- Ex: Air, truck,
- In data communications the definition of the information and the transmission medium is more specific
- Ex: free space, metallic cable, fiber optic cable.

# Transmission Media

- The use of long-distance communication using electric signals started with the invention of the telegraph by Morse in the 19th century.
- Telephone-Human voice -1869.
- Use metallic medium
- Connection unreliable due to poor quality of signal.

# Classes of Transmission Media

# Selection of Transmission Media

## Factors:

- Transmission Rate
- Cost and ease of Installation
- Resistance to environmental condition
- Distance between sender and receiver

# Guided Media

- It Provides a conduit from one device to another, include twisted pair, coaxial and fiber optic cable.
- A signal traveling along any of these media is directed and contained by the physical limits of the medium
- Twisted-pair and coaxial cable use metallic (copper) conductors that accept and transport signals in the form of electric current.
- Optical fiber is a cable that accepts and transports signals in the form of light.

# Twisted-Pair Cable

- One wire is used to carry signals and other used as a ground reference.
- Why the two wire twist together?
- Why not in parallel?

# Effect of Noise on Parallel Lines

# Noise on Twisted-Pair Lines

# Twisted-Pair Cable- UTP and STP

- STP has metal foil, that improves the quality of cable by preventing the penetration of noise or crosstalk
- STP is expensive

Unshielded twisted pair (UTP)

Shielded twisted pair (STP)

# Twisted-pair cable Connectors

- RJ-45
- RJ stands for registered jack

# PINOUT

**RJ45 Pinout

# Categories of UTP Cables

<i>Category</i>	<i>Specification</i>	<i>Data Rate (Mbps)</i>	<i>Use</i>
1	Unshielded twisted-pair used in telephone	< 0.1	Telephone
2	Unshielded twisted-pair originally used in T-lines	2	T-llines
3	Improved CAT 2 used in LANs	10	LANs
4	Improved CAT 3 used in Token Ring networks	20	LANs
5	Cable wire is normally 24 AWG with a jacket and outside sheath	100	LANs
SE	An extension to category 5 that includes extra features to minimize the crosstalk and electromagnetic interference	125	LANs
6	A new category with matched components coming from the same manufacturer. The cable must be tested at a 200-Mbps data rate.	200	LANs
7	Sometimes called SSTP (shielded screen twisted-pair). Each pair is individually wrapped in a helical metallic foil followed by a metallic foil shield in addition to the outside sheath. The shield decreases the effect of crosstalk: and increases the data rate.	600	LANs

# Performance

# Applications

- Used in telephone lines to provide voice and data
- In Local area network
- 10Base-T
- 100Base-T

# Advantages:

- Twisted pair cable are oldest and most popular cable all over the world.
- Trained personnel easily available.
- Can be used for both analog and digital transmission.
- Least expensive for short distances.
- Entire network does not go down if a part of network is damage.
- Easy to install and maintain.
- Low weight.

# Disadvantages:

- Signal can not travel long distance without repeaters due to attenuation.
- High error rate for distance greater than 100m
- Very thin and hence break easily.
- Not suitable for broadband connection.
- Low bandwidth

# Coaxial Cable

- coax has a central core conductor of solid or stranded wire(usually copper) enclosed in an insulating sheath, which is, in turn, encased in an outer conductor of metal foil, braid, or a combination of the two which completes the circuit.
- This outer conductor is also enclosed in an insulating sheath, and the whole cable is protected by a plastic cover.

# Coaxial Cable

# Coaxial Cable Standards

- Each Radio government(RG) ratings denotes unique set of physical specifications.

<i>Category</i>	<i>Impedance</i>	<i>Use</i>
RG-59	75 $\Omega$	Cable TV
RG-58	50 $\Omega$	Thin Ethernet
RG-11	50 $\Omega$	Thick Ethernet

# Coaxial Cable Connectors:

- Bayone-Neill-Concelman (BNC).
- BNC connector,
- BNC T connector
- BNC terminator

# Coaxial Cable Connectors:

- The BNC connector is used to connect the end of the cable to a device, such as a TV set.
- The BNC T connector is used in Ethernet networks to branch out to a connection to a computer or other device
- The BNC terminator is used at the end of the cable to prevent the reflection of the signal.

**BNC Connector**

**BNC T**

**BNC Terminator**

# Coaxial Cable Application

- Analog cable TV.
- Telephone network:
- Single coaxial carry 10000 voice signals.
- Digital data upto 600Mbps.
- 10 Base 2 (Thin Ethernet) RG-58 coaxial cable with BNC connector - 10Mbps -185 m
- 10Base 5(Thick Ethernet) RG-11 -10Mbps -5000m.

# Advantages of Coaxial Cable

- Excellent noise immunity
- Signal can travel longer distance at higher speed (1 to 2Gbps in 1 km)
- Can be used for both analog and digital.
- Inexpensive cmp to fiber optics.
- Easy to install and maintain.

# Disadvantages of Coaxial Cable

- Not compatible with twisted pair cable.
- Expensive as compare to twisted pair cable.

# Optical fiber

- Made up of glass or plastic
- Transmit Signal in form of light
- Nature of light
- Optical fibers use reflection to guide light through channel.

**Angle of incidence** : angle the ray makes with the line perpendicular to the interface between the substances

# Refraction

a. From less dense to more dense medium

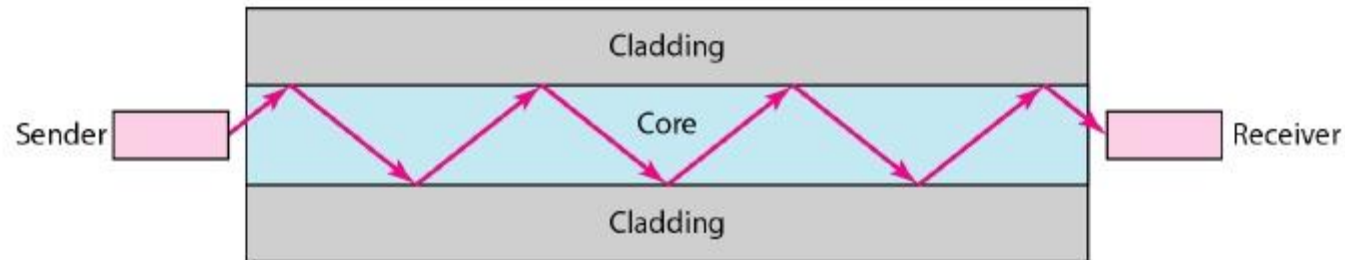

b. From more dense to less dense medium

# Reflection

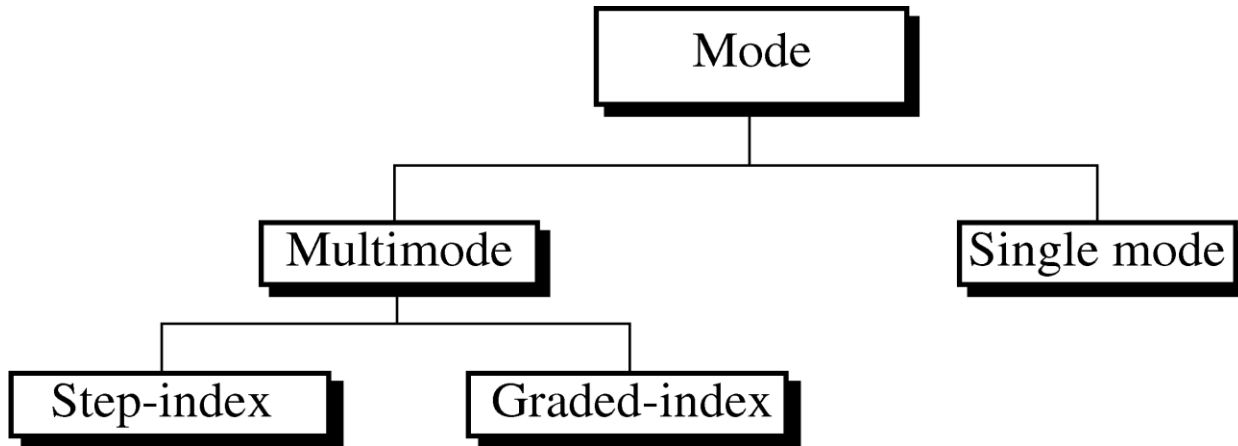

# Optical fiber

- Optical fibers use reflection to guide light through a channel
- A glass or plastic core is surrounded by cladding of glass
- Difference in density of the two materials must be such that a beam of light moving through the core is reflected off the cladding instead of being refracted into it

# Optical fiber – Propagation modes

# Multimode Step-Index

- The density of the core remains constant from the center to the edges
- At interface, there is an abrupt change due to a lower density – this alters the angle of beam's motion
- Distortion of the signal.

# Multimode Graded-Index

- The word index here refers to the index of refraction
- Density is highest at the center of the core and decreases gradually to its lowest at the edge

# Single Mode

- Source of light that limits beams to a small range of angles, all close to the horizontal.
- Much smaller diameter
- Critical angle that is close to 90
- Used for long distance communication.

- + Low cost sources
  - + 850 nm and 1310 nm LEDs
  - + 850 nm lasers at 1 & 10 Gb/s
  - + Low precision packaging
- + Low cost connectors
- + Lower installation cost
- Higher fiber cost
- + Lower system cost
- Higher loss, lower bandwidth
- Distance up to 2 km

**Best for:**

- LAN, SAN, Data Center, CO

- High cost sources
  - 1310+ nm lasers 1 and 10 Gb/s
  - 1 Gb/s + w/ DWDM
  - High precision packaging
- Higher cost connectors
- Higher installation cost
- + Lower fiber cost
- Higher system cost
- + Lower loss, higher bandwidth
- + Distance to 60 km+

**Best for:**

- WAN, MAN, Access, Campus

# Fiber size

Type	Core ( $\mu\text{m}$ )	Cladding ( $\mu\text{m}$ )	Mode
50/125	50.0	125	Multimode, graded index
62.5/125	62.5	125	Multimode, graded index
100/125	100.0	125	Multimode, graded index
7/125	7.0	125	Single mode

Optical Fiber Core Diameters

# Fiber Cable Composition

# Fiber-cable connector

- The subscriber channel (SC) connector is used for cable TV
- The straight-tip (ST) connector is used for connecting cable to networking devices.
- MT-RJ is a connector that is the same size as RJ45

# Optical fiber Application

- Use in backbone network( Transfer data at a rate of 1600 Gbps)
- SONET network
- Cable TV use hybrid network

# Advantages:

- Higher bandwidth
- Less signal attenuation
- Fiber-optic transmission distance is significantly greater than that of other guided media.
- A signal can run for 50 km without requiring regeneration.
- Immunity to electromagnetic interference
- Resistance to corrosive materials. Glass is more resistant to corrosive materials than copper
- Light weight. Fiber-optic cables are much lighter than copper cables.
- Greater immunity to tapping.

# Disadvantages

- *Installation and maintenance:* Fiber-optic cable is a relatively new technology. Its installation and maintenance require expertise that is not yet available everywhere.
- *Unidirectional light propagation:* Propagation of light is unidirectional. If we need bidirectional communication, two fibers are needed.
- *Cost :* The cable and the interfaces are relatively more expensive than those of other guided media

# Unguided Media

Unguided media transport electromagnetic waves without using a physical conductor. This type of communication is often referred to as wireless communication.

Electromagnetic spectrum for wireless communication

# Propagation methods

Unguided signals can travel from the source to destination in several ways

- **Ground propagation:** travel through lowest portion, signals emanate in all directions
- **Sky propagation:** higher frequency radiowave, greater distances with lower output signal
- **Line – of – sight propagation:** very high frequency signals are transmitted in straight lines directly from antenna to antenna

# Propagation methods

Ionosphere

Ground propagation  
(below 2 MHz)

Ionosphere

Sky propagation  
(2–30 MHz)

Ionosphere

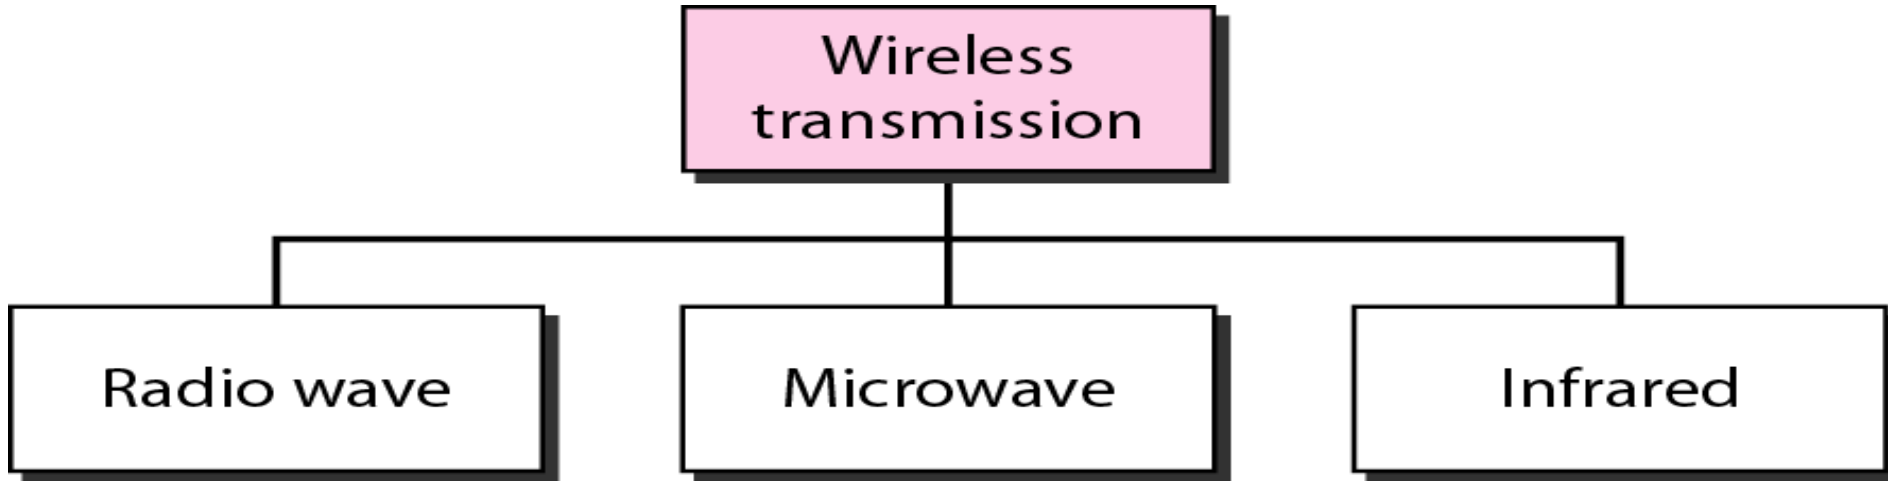

Line-of-sight propagation  
(above 30 MHz)

# Electromagnetic spectrum Bands

<i>Band</i>	<i>Range</i>	<i>Propagation</i>	<i>Application</i>
VLF (very low frequency)	3–30 kHz	Ground	Long-range radio navigation
LF (low frequency)	30–300 kHz	Ground	Radio beacons and navigational locators
MF (middle frequency)	300 kHz–3 MHz	Sky	AM radio
HF (high frequency)	3–30 MHz	Sky	Citizens band (CB), ship/aircraft communication
VHF (very high frequency)	30–300 MHz	Sky and line-of-sight	VHF TV, FM radio
UHF (ultrahigh frequency)	300 MHz–3 GHz	Line-of-sight	UHF TV, cellular phones, paging, satellite
SHF (superhigh frequency)	3–30 GHz	Line-of-sight	Satellite communication
EHF (extremely high frequency)	30–300 GHz	Line-of-sight	Radar, satellite

# Wireless transmission waves

# Radio Waves

- Electromagnetic waves ranging in frequencies between 3kHz and 1GHz
- Omnidirectional antenna
- When antenna transmits radio waves, they are propagated in all directions
- No aligned
- Signal may interference by another antenna
- It can penetrate walls
- Used for multicasting, AM and FM radio, cordless

# Micro Waves

- Electromagnetic waves ranging in frequencies between 1GHz – 300 GHz
- Microwaves are unidirectional
- Sending and receiving antennas need to be aligned
- Microwave propagation is line-of-sight.
- Very High frequency microwaves can not penetrate walls
- Wider subbands can be assigned, high data rate possible
- Use of certain portions of the band requires permission from authorities

# Unidirectional antennas

- Two types of antennas: parabolic dish and horn

a. Dish antenna

## Dish Antenna

- Every line parallel to the line of symmetry reflects off the curve at angles such that all lines intersect in a common point called the focus.
- Work as funnel
- Catch wide range of waves and directing them in common point.
- More signal is recovered

# Unidirectional antennas

b. Horn antenna

## Horn Antenna

- Looks like gigantic scoop
- Outgoing transmissions deflected outward in series of narrow parallel beams by curved head.

# Microwave Applications

## 1. Satellite Communication

## 2. GEO

## 3. Cellular system

# Infrared

- 300GHz to 400GHz
- Wavelength: 1mm to 770 nm
- Used for short range communication
- High frequency
- Can not penetrate wall
- Infrared remote control
- Useless for long communication
- Can not use outside the building

# Infrared- Application

- 400THz
- Excellent potential for data transmission.
- IrDA(Infrared Data Association)
- Keyboard, mice, PCs and printer.
- Infrared signals defined by IrDA transmit through line of sight, the IrDA port on the keyboard needs to point to the PC for transmission to occur.
- 75kbps to 4Mbps.
